

RealTime Inventory Manager

RealTime Inventory Manager is the central hub of RealTime. It allows the setup of your company and stockroom characteristics along with label and document routing options.

It also provides inventory transaction processing in real time for miscellaneous receipt, miscellaneous issue, single step transfer and stock counting.

RealTime Inventory Manager, in combination with handheld devices, replaces the manual keying of inventory transaction details into System 21.

Handheld devices are used to quickly and accurately record the item numbers, quantities and movement of stock into and out of user defined stockrooms. This process can dramatically reduce the amount of time and administration effort required to receive, issue, move and count stock.

The result is the realisation of more timely and accurate inventory data with detailed movement history that management can access with confidence.

Key Features/Benefits

- ▶ Enables System21 inventory transactions to be carried out on handheld devices through the use of industry standard barcode scanning of items and inventory data.
- ▶ Batch/lot and serial number capture for comprehensive product and movement tracking.
- ▶ Improved productivity by eliminating manual recording of movements and subsequent keying into System21.
- ▶ Real time verification of inventory data and automatic update of transactions, reducing elapsed time and increasing data accuracy.
- ▶ Fully integrated with System 21, all stock and movement history is recorded with real time date, time and operator identification providing accurate auditing.
- ▶ In-built stock counting functionality enables efficient and accurate recording of the current inventory levels to allow standard System 21 adjustments to be carried out if required.
